

THE UPHILL BATTLE IS OVER

Double Barrel CS is a selectable climbing mode on Cane Creek shocks that allows you to retain the advantages of a fully-suspended bike while climbing, without unwanted suspension motion. CS is not a conventional pedal-platform as it adjusts both low speed compression and low speed rebound.

The Climb Switch changes the low speed damping in one simple switch, to optimize suspension dynamics during climbing. It does this by turning on and off a set of internal 'climbing circuits' that are accessed when CS is engaged. Cane Creek tunes the 'climbing circuits' specifically for the demands of off-road climbing to achieve improved pedaling efficiently with less chassis motion. When you are ready to descend, with the flip of CS, the shock returns to the traditional low-speed circuits of the Double Barrel.
